A2W-Macro

Long strings can overflow stack

- Unhandled Exception

Software Context

String Conversion MACROS

Description

A2W macros can lead to stack overflows or unhandled exceptions. The Microsoft Active Template Library (ATL) is a set of template-based C++ classes that simplify the programming of Component Object Model (COM) objects. It provides the A2W set of macros for converting between ASCII and wide (Unicode) characters. The A2W macros call _alloca(), which allocates memory from the stack. If the input string is too long, so that the stack would overflow, _alloca() will throw an exception. If the exception is not caught, the program will halt.

Application Programming Interfaces

Function Name	Comments
A2W	
CW2CT	
W2A	

Method of Attack

An attacker can provide very long strings of input to vulnerable methods potentially gobbling up all the stack space. If the appropriate exceptions are not caught, the program will halt causing a DoS.

Solutions

Applicability	Description	Efficacy
Whenever A2W macros are used.	Avoid use of these methods. New conversion macros were introduced in ATL 7.0. These macros, which have somewhat different usage, are more robust and do not allocate memory on the stack. Use these instead of the older A2W macros. If you can't use the ATL 7.0 conversion macros, always wrap the conversion with an exception handler. Reset the stack if stack overflow exceptions occur. MSDN advises "Check the length of the strings before passing them to these macros to avoid potential buffer overrun problems. Stack overflows are exceptions that could also be caught with try/except." The length of string that would be problematic depends on how the /STACKSIZE linker option is used. It is not clear how stack overflows would occur for these macros. Possibly this recommendation refers only to the older macros. Check the input length before using any of these macros to ensure that lengths are not dangerously large	Believed to be effective.

Signature Details

Presence of any of the A2W macros identified above.

Examples of Incorrect Code

- Example 1

```
// Note use of older macro that allocates stack memory.
// Does conversion, but could overflow stack and throw exception

LPCTSTR szr = A2T( szReplaceFile );
```

Examples of Corrected Code

- Example 1

```
// Use new macro
// Note form of code above doesn't work for new macros

if (strlen(szReplaceFile) > MAX_REASONABLE_SIZE) { /* handle error */ }
else {CA2TEX szr( szReplaceFile );}
```

- Example 2

```
// If must use older macro, catch exception and reset stack

if (strlen(szReplaceFile) > MAX_REASONABLE_SIZE) { /* handle error */ }
__try {
        LPCTSTR szr = A2T( szReplaceFile );
        // use szr
    } __except ((EXCEPTION_STACK_OVERFLOW == GetExceptionCode()) ?
                   EXCEPTION_EXECUTE_HANDLER :
                   EXCEPTION_CONTINUE_SEARCH) {
        _resetstkoflw();
    }
```
